Canadian mobile optical splitter is full

Overview

Key Takeaways

A "full" Canadian mobile optical splitter indicates that all available output ports are in use, limiting the addition of new subscribers without network expansion. Understanding a Full Optical SplitterIn a Passive Optical Network (PON), an optical splitter divides a single input signal from the Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at user locations. Splitters are passive devices, meaning they require no power, and their capacity is defined by the split ratio (e.g., 1: 8, 1: 32, 1: 64) which determines how many ONTs can be connected to a single OLT port.

When a splitter is "full," all its output ports are occupied, and no additional subscribers can be connected without exceeding the designed bandwidth or power budget. Implications of a Full SplitterBandwidth Sharing: Each ONT shares the total bandwidth from the OLT. Adding more users beyond the splitter's capacity can degrade service quality.

Network Limitations: A full splitter prevents new connections in that segment of the network until additional capacity is added. Operational Constraints: Maintenance or reconfiguration may be required to accommodate new subscribers, especially in centralized splitter architectures where jumper reassignments are possible.

Solutions and Expansion Options

Deploy Additional Splitters: Adding a new splitter in a distributed or centralized configuration can increase capacity. Centralized splitters allow flexible reassignment of ONTs via jumpers, while distributed splitters are fixed once installed. Upgrade Splitter Type: Switching from a smaller split ratio (e.g., 1: 16) to a larger one (e.g., 1: 32 or 1: 64) can accommodate more users, though this may reduce optical power per port and require careful planning.

Install a New OLT Port: Expanding the OLT with additional ports and connecting new splitters can relieve congestion on full splitters.

Use High-

Quality PL

C Splitters: Canadian suppliers like Lindsay Broadband offer compact, low-loss PLC splitters that support higher port counts and reliable performance, which can help optimize existing network infrastructure.

Best Practices

Monitor Splitter Utilization: Track port usage to anticipate when a splitter will reach capacity. Plan for Scalability: Design networks with modular splitters and flexible architectures to accommodate future growth. Balance Split Ratios and Power Budget: Ensure that increasing the number of outputs does not compromise signal quality at the ONTs.

By understanding the splitter's capacity and planning for expansion, Canadian mobile operators can maintain service quality while accommodating new subscribers efficiently.
