Central Asia Underground Temperature Measurement Optical Cable Factory

Overview

This study introduces an alternative system for monitoring the temperature of underground cables using NTC thermistors.

Key Takeaways

Underground optical cable temperature monitoring in Central Asia can be achieved using Distributed Temperature Sensing (DTS) systems or wireless sensor modules, providing real-time, high-precision thermal data for power and communication networks. Distributed Temperature Sensing (DTS) SystemsDTS systems use optical fibers embedded in or attached to underground cables to continuously monitor temperature along the cable length. Light pulses travel through the fiber, and scattered light signals (Raman scattering) are analyzed to determine temperature profiles with accuracy better than 1°C over distances up to 40 km, extendable to 70 km with long-range systems.

These systems allow operators to detect hot spots, calculate real-time cable load, and optimize ampacity without physical access to the cable.

DT

S systems are highly reliable, immune to electromagnetic interference, and can operate in harsh environments with temperatures ranging from -10°C to 60°C.

Wireless Temperature Monitoring Solutions

For areas where fiber-optic DTS may be cost-prohibitive, wireless temperature measurement modules can be installed directly on underground cables and joints. These systems use passive wireless sensors to transmit temperature data to a receiver located near the cable well or manhole. This approach enables real-time monitoring of cable bodies and intermediate joints, helping prevent failures or fire hazards in cable-dense areas.

Wireless systems are particularly useful for retrofitting existing networks without extensive cable modifications. System Features and BenefitsReal-Time Thermal Rating (RTTR): DTS systems calculate conductor temperature in real time, allowing temporary operation above nominal capacity during peak loads. Hotspot Detection: Continuous monitoring identifies localized overheating, reducing the risk of cable damage.

Dynamic Cable Rating (DCR): Combines thermal models with real-time measurements to optimize network performance and extend cable lifespan. Scalability: Both DTS and wireless systems can be adapted for medium- and high-voltage networks, supporting multiple measurement points along long cable runs. Reliability: DTS controllers have no moving parts and feature self-diagnosing capabilities, ensuring long-term operation with minimal maintenance.

Applications in Central Asia

In Central Asia, where underground power and communication networks are expanding, these systems are ideal for: Urban power distribution networks with limited access to underground cables. High-voltage transmission lines requiring precise thermal management. Critical infrastructure monitoring to prevent outages and optimize energy transport.

Conclusion

For underground optical cable temperature monitoring in Central Asia, DTS systems provide high-precision, long-distance monitoring, while wireless sensor modules offer cost-effective, scalable alternatives. Both technologies enable real-time thermal management, hotspot detection, and dynamic cable rating, ensuring safe and efficient operation of underground power and communication networks.

Article Content

A Sensor for Multi-Point Temperature Monitoring in Underground

This study introduces an alternative system for monitoring the temperature of underground cables using NTC thermistors. Its design allows for reducing the number of connection conductors for

Temperature monitoring techniques of power cable joints in

This study proposed a sensor module that can monitor the temperature of the power cable joint using a fiber optic sensor. The advantage of using fiber optic sensors is that they are not

Temperature Monitoring System for UG Power Cable (DTS)

A distributed temperature sensor (DTS) is applied to continuously monitor the temperature of the underground cable. The DTS measurement principle must be based on the response time of the

Factory Direct Fiber-Optic Distributed Temperature Sensing (DTS)

It specializes in providing advanced intelligent temperature control equipment and fiber optic temperature measurement systems, and offers customers a complete set of online monitoring solutions.

Distributed optical fibre sensor for infrastructure monitoring: Field ...

The project employed two optical fibre cables for temperature and strain measurements positioned on top of the pipeline in soft backfill material. During the monitoring period, numbers of

Distributed Temperature Sensing and Real Time Thermal Rating for ...

This paper presents the distributed temperature sensing (DTS) technology and its application mainly on underground power cables. The main measuring principle is detecting the back-scattering light via

Distributed Temperature Sensing (DTS) | AP Sensing

Distributed Temperature Sensing (DTS) systems provide temperature information for accurate thermal monitoring, fire detection, and condition assessment by utilizing standard fiber optic cables.

Prevent Cable Failures w. Underground Cable Monitoring | AP Sensing

Our underground cable monitoring solution provides enhanced reliability, cost efficiency, and improved safety through comprehensive monitoring of temperature, acoustic signals, and vibration across the
