# Check the MAC address of the interface on the switch

## Overview

How to Find a Device MAC Address on a Cisco SwitchIn this article, we'll explore how this can be done on Cisco-based networks ranging from a single switch.

## Key Takeaways

To find the MAC address of a switch interface, you can use commands in the switch's command-line interface (CLI) such as show version or show mac address-table.

### Steps to Find the MAC Address

Access the Switch CLI: Connect to the switch using a console cable or SSH. Log in with your credentials.

### Use the Command to Display the MA

C Address: Show Version Command: This command displays the base MAC address of the switch. Type: BashCopyshow version Look for the line that says "Base ethernet MAC address" in the output. This is the MAC address used for protocols like Spanning Tree Protocol (STP).

### Show MA

C Address Table Command: To see the MAC addresses learned by the switch and the corresponding ports, use: BashCopyshow mac address-table This command will display a table with MAC addresses, VLANs, and the ports they are associated with.

### Identify the MA

C Address of a Specific Interface: If you want to find the MAC address for a specific interface, you can use: BashCopyshow interface {interface_name} Replace {interface_name} with the actual interface (e.g., GigabitEthernet0/1). This will show detailed information about the interface, including its MAC address. Additional MethodsWeb-Based Management Interface: If your switch has a web interface, you can log in and navigate to the system information or device details section to find the MAC address.

Physical Inspection: Sometimes, the MAC address is printed on a label on the back or bottom of the switch. By following these steps, you can easily find the MAC address of a switch interface, which is essential for network management and troubleshooting.
