Overview

The short answer: you don''t need a modem, you need an ONT — and your fiber provider will supply it.

Key Takeaways

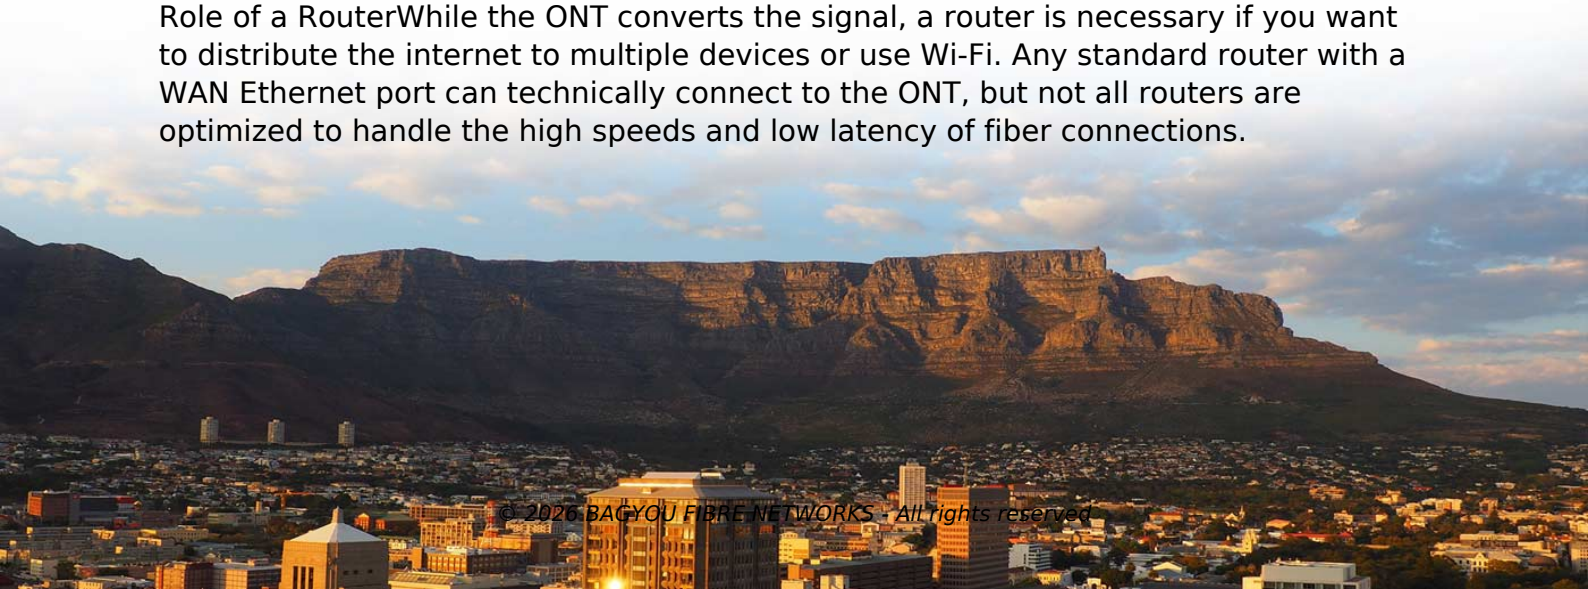

A router is generally required to share fiber optic internet across multiple devices, but technically, any router with a WAN Ethernet port can connect to the Optical Network Terminal (ONT) provided by your ISP.

Understanding Fiber Optic Internet Setup

Fiber optic broadband delivers data as light signals through fiber cables, which must be converted into electrical signals for your devices. This conversion is handled by an Optical Network Terminal (ONT), which acts similarly to a modem in traditional cable or DSL setups.

The ON

T provides an Ethernet output that can connect directly to a router or a single device. Role of a RouterWhile the ONT converts the signal, a router is necessary if you want to distribute the internet to multiple devices or use Wi-Fi. Any standard router with a WAN Ethernet port can technically connect to the ONT, but not all routers are optimized to handle the high speeds and low latency of fiber connections.

Features that improve performance include: High-speed processing to manage gigabit-level data transferMulti-gigabit Ethernet ports for wired connectionsLow latency for gaming and video conferencingQuality of Service (QoS) to prioritize bandwidth for critical applicationsFiber-Ready vs Standard RoutersA fiber-ready router is designed to fully utilize fiber internet speeds, offering faster, more reliable connections and lower latency compared to standard routers. Standard routers can work with fiber, but may not deliver the full potential of your connection, especially for high-bandwidth activities like 4K streaming, online gaming, or multiple simultaneous users.

Summary

Router is not strictly mandatory if you only connect a single device to the ONT. Router is required to share the connection across multiple devices or to use Wi-Fi. Fiber-optimized routers enhance speed, reliability, and performance, but standard routers can still function with fiber broadband.

Choosing the right router depends on your internet speed, number of devices, and desired network performance.
