Fiber optic grounding wire for 144-core fiber optic cable

Overview

AFL''s HexaCore OPGW (Optical Ground Wire) delivers up to 144 fibers in a compact, high-strength design for overhead power lines.

Key Takeaways

A 144-core fiber optic cable for overhead power lines is typically implemented as an Optical Ground Wire (OPGW), combining high fiber count with grounding and lightning protection. Overview of 144-Core OPGWA 144-core OPGW is a dual-function cable designed to replace traditional overhead ground wires while providing a telecommunications path through embedded optical fibers. It is suitable for high-voltage transmission lines and can withstand mechanical stresses from wind, ice, and electrical faults without damaging the fibers inside.

These cables are ideal for utilities requiring both enhanced fiber capacity and reliable grounding.

Construction

Central stainless steel tube: Houses the optical fibers, often in loose or small-diameter tubes to allow high fiber counts without increasing cable diameter. Aluminum-clad steel or aluminum alloy wires: Surround the central tube to provide mechanical strength and electrical conductivity for grounding and lightning protection. Layered stranding: Multiple layers of metallic wires protect the fibers and ensure the cable can conduct short-circuit currents safely.

Water-blocking gel: In some designs, the central tube contains gel to protect fibers from moisture and environmental damage.

Grounding and Electrical Considerations

The metallic components of OPGW act as a grounding path, conducting lightning strikes and short-circuit currents safely to the earth while protecting the optical fibers.

OPG

W must maintain continuity and conductivity along the transmission line, ensuring that the grounding function is not interrupted by mechanical or environmental stresses. Installation should follow industry standards for grounding, including proper bonding to the transmission line towers and grounding electrodes.

Applications

Replacement of aged ground wires on high-voltage transmission lines. Integration of telecommunications networks with power infrastructure. Environments requiring high fiber counts (up to 144 fibers) without significantly increasing cable weight or diameter.

Summary

For a 144-core fiber optic cable, an OPGW cable such as AFL HexaCore or composite OPGW is recommended. These cables combine high fiber capacity, mechanical strength, and grounding capability, making them suitable for overhead power line installations where both telecommunications and electrical protection are required. Proper installation ensures both fiber integrity and effective grounding.
