How many devices can be connected via mobile broadband GPON

Overview

How Many ONUs Can an OLT PON Port Support?

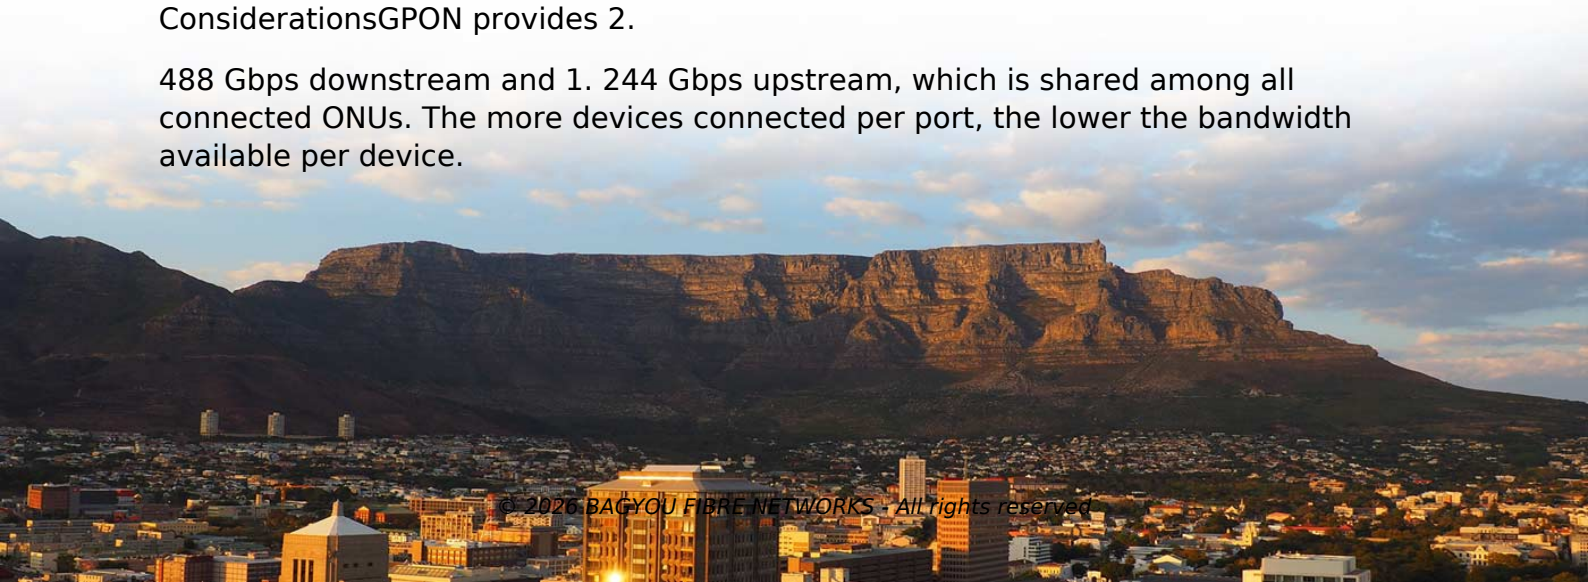

Discover the maximum number of ONUs supported per OLT PON port in EPON and GPON networks, with split ratio plann.

Key Takeaways

A single GPON port can theoretically support up to 128 ONUs, but in practice, most deployments use 64 ONUs per port. Theoretical vs Practical LimitsGPON (Gigabit Passive Optical Network) uses a point-to-multipoint architecture where a single Optical Line Terminal (OLT) port connects to multiple Optical Network Units (ONUs) or Optical Network Terminals (ONTs) through passive optical splitters. The split ratio determines how many ONUs a single port can serve.

Theoretically, GPON supports a maximum split ratio of 1: 128, meaning one OLT port could connect to 128 ONUs. However, in real-world deployments, operators often use a 1: 64 split ratio to ensure stable bandwidth and quality of service, especially for high-traffic applications like IPTV, VoIP, or business services. Bandwidth ConsiderationsGPON provides 2.

488 Gbps downstream and 1. 244 Gbps upstream, which is shared among all connected ONUs. The more devices connected per port, the lower the bandwidth available per device.

Therefore, network planners balance the number of connected devices with expected traffic to maintain performance. For example, a 1: 64 split ratio is commonly chosen to provide sufficient bandwidth per user while keeping deployment costs reasonable.

Deployment Factors

Several factors influence the practical number of devices per GPON port: Service type: Residential vs business users have different bandwidth needs. Distance and optical power loss: Longer fiber runs reduce signal strength, limiting the number of ONUs. Quality of Service (QoS): High-demand applications may require fewer ONUs per port to maintain performance.

Network scalability: Operators may plan for future growth by using conservative split ratios.

Summary

Maximum theoretical devices per GPON port: 128 ONUsCommon practical deployment: 64 ONUs per portBandwidth per device: Shared among all connected ONUs, affected by split ratio and traffic demandKey factors: Service type, distance, optical power, and QoS requirementsThis means that while GPON can support a large number of devices, network design typically limits connections to ensure reliable performance and user experience.

Gigabyte Passive Optical Network (GPON)

A GPON network can reach up to 20 km and provide service up to 64 end users. GPON utilizes both upstream and downstream data by means of Optical Wavelength Division Multiplexing (WDM).

Passive optical network

In this one-to-many topology, a single fiber serving many sites branches into multiple fibers through a passive splitter, and those fibers can each serve multiple sites through further splitters.
