How to check the number of times a fiber optic patch cord has been plugged and unplugged

Overview

The three standard methods for testing fiber optic cabling are a visible light source, power meter and light source, and optical time domain reflectometer (OTDR). These fibers are most commonly made of glass and are very thin, typically less than a tenth of the width of a human hair. As the components like fiber, connectors, splices, LED or laser sources, detectors and receivers are being developed, testing confirms their performance specifications and helps. Fiber optic networks require several types of tests to evaluate the overall performance and reliability of the cables, splices, connectors, and network components. These tests help you determine if the network is functioning correctly and whether it can handle future bandwidth needs.
