Key Takeaways

A dual distribution box (dual split load consumer unit) is wired by connecting the main switch to two RCDs, which then feed separate MCB banks, ensuring each RCD protects its own set of circuits. Components RequiredTwo-pole main switch MCBTwo two-pole RCDs (Residual Current Devices)Single-pole MCBs for individual circuitsPhase (live) and neutral wiresCommon neutral busbarTools: screwdriver, wire stripper, multimeter, insulation tapeStep-by-Step Wiring Process1. Safety First Always turn off the main power supply before starting any wiring.

Verify with a multimeter that no voltage is present to avoid electrical shock ( ). 2. Mount the Distribution Box Secure the box on a wall at an accessible height (~1.

5m) in a dry, ventilated area. Ensure it is free from obstructions ( ). 3.

Connect the Main Switch The two-pole main switch receives the incoming phase and neutral from the service cable. This switch controls power to both RCDs simultaneously ( ). 4.

Wire the RCDsConnect the output phase wire from the main switch to the input terminals of both RCDs. Connect the neutral from the main switch to the common neutral busbar.

Each RC

D will have its own neutral terminals (Neutral 1 for RCD#1, Neutral 2 for RCD#2) to feed its respective MCB bank ( ). 5.

Connect the MC

B BanksRCD#1 feeds the first set of single-pole MCBs (e.g., circuits for downstairs). RCD#2 feeds the second set of MCBs (e.g., circuits for upstairs). Ensure each MCB input is connected to the corresponding RCD output and the neutral is connected to the assigned neutral terminal ( ).

6.

Label and Test

Clearly label each circuit for easy identification. Use a multimeter to check for correct voltage, continuity, and absence of short circuits before powering on ( ).

Safety and Best Practices

Never connect all lighting points to a single RCD to avoid total blackout during a fault ( ). Use proper wire gauge and insulation according to load requirements. Include surge protection if necessary.

Follow local electrical codes (e.g., BS 7671, IEC, IET standards) and use certified components ( ). Schedule regular inspections to maintain long-term reliability ( ). By following these steps, a dual distribution box can be safely and efficiently wired, providing separate protection for different sections of a building while maintaining full earth leakage protection.
