Installation of 144 Optical Distribution Box

Overview

The URM LH 144S optical distribution box is designed for the placement of 144 optical splices indoor and outdoor.

Key Takeaways

A 144-fiber Optical Distribution Box (ODF) can be installed by securely mounting the cabinet, preparing and routing fiber cables, splicing fibers into trays, connecting adapters, and ensuring proper cable management and safety precautions.

Preparation and Mounting

Select the installation site: Ensure a stable, accessible location, preferably on a cement base for outdoor cabinets or a 4U rack for modular indoor units. Mount the cabinet: Open the base cover, align the cabinet with mounting holes, and secure it using bolts. Ensure the cabinet is level and stable.

Grounding: Connect the grounding wire to the cabinet to prevent electrical hazards.

Cable Entry and Preparation

Route the fiber optic cable through the designated entry points. Strip the outer jacket carefully, exposing the fiber cores without damaging them. Secure the cable using cable clamps and strengthen core fixing kits to prevent movement.

Insert fibers into protective tubes to maintain bend radius and prevent microbends.

Splicing and Termination

Organize fibers into splice trays: Each tray typically holds 12 fibers; a 144-fiber ODF will have 12 trays preloaded with pigtails and adapters. Fusion splice fibers to pigtails or patch cords using a fusion splicer, following manufacturer guidelines. Connect adapters: Use compatible adapters (FC, SC, ST, or duplex LC) to link trays or patch panels.

Manage slack: Coil excess fiber in the tray to maintain proper bend radius and avoid stress on fibers.

Final Steps

Close the cabinet door securely after all connections are completed. Label fibers and trays for easy identification and maintenance. Test connections using an OTDR or power meter to ensure signal integrity.

Safety precautions: Always wear safety glasses when cutting fibers and avoid looking directly into fiber ends, as laser light may be present.

Maintenance and Operation

The OD

F allows for easy expansion and reconfiguration of fibers. Keep the cabinet clean and dry, and periodically check for loose connections or damaged fibers. Maintain a record of splicing and patching for troubleshooting and network management.

By following these steps, a 144-fiber Optical Distribution Box can be installed efficiently, ensuring reliable fiber management, protection, and connectivity for FTTH or access network deployments.
