Instrument cable tray static busbar grounding

Overview

Instrument Grounding Standards This standard specifies the classification, methods, system structure, grounding resistance, and design principles of instru.

Key Takeaways

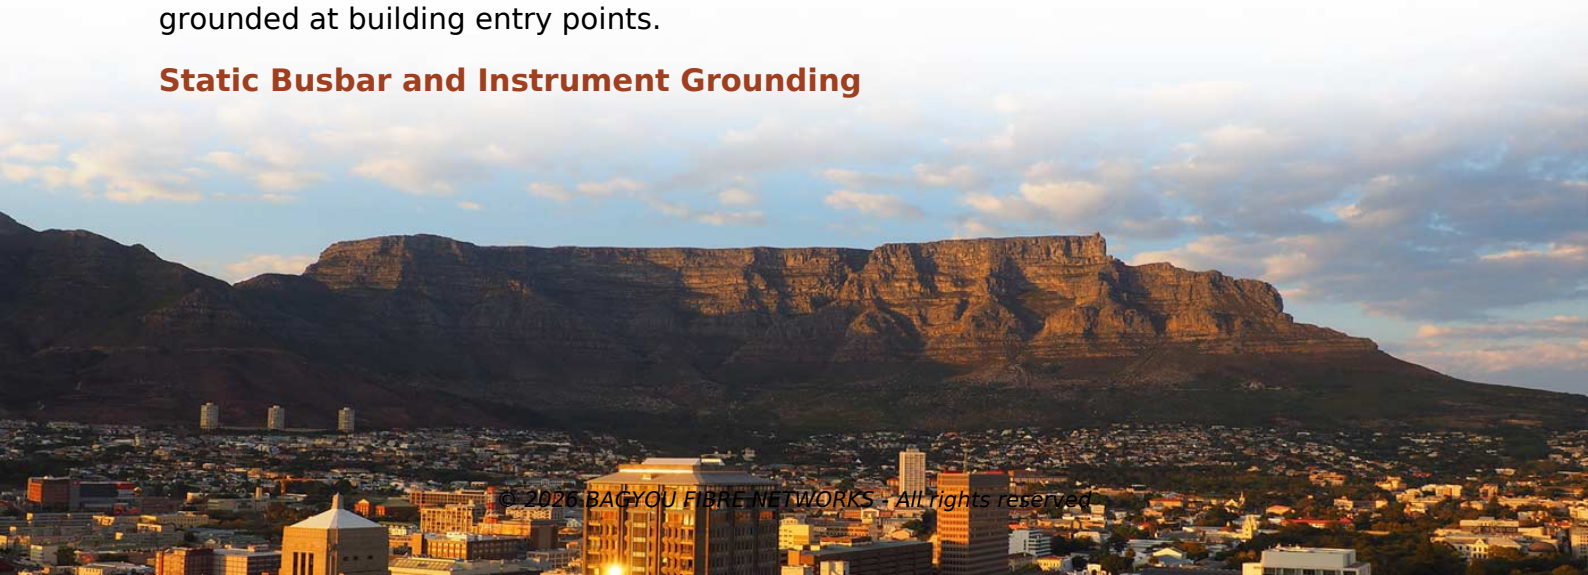

Proper grounding of instrument cable trays and static busbars ensures safety, prevents ground loops, and maintains signal integrity in instrumentation systems.

Grounding Principles for Cable Trays

All metallic cable trays must be grounded to the plant or building grounding system, regardless of whether they carry an equipment grounding conductor (EGC) or not. Grounding should be achieved using grounding clamps at each tray section or at alternate sections, ensuring a continuous low-impedance path to the main ground. For aluminum trays, insulated conductors should be used to prevent electrolytic corrosion, with insulation removed at bonding points using tin or zinc-plated connectors.

Maximum spacing for grounding points is typically 30 meters, and trays should be grounded at building entry points.

Static Busbar and Instrument Grounding

A static busbar serves as a common grounding point for instrument cases, panel frames, and other metallic components. All instrument grounds should be wired to a common busbar within the control room, which is then connected to a remote ground electrode via an independent cable, preferably duplicated for redundancy. The resistance to ground should generally not exceed 1 ohm unless specified by the manufacturer.

For intrinsically safe (IS) systems, a dedicated IS ground bus is required to maintain a single-point ground and prevent ground loops. Signal cable shields should be grounded at one point only, typically at the control room end, while the field end is cut back and insulated to avoid multiple grounding points. This prevents electromagnetic interference and ensures accurate signal measurements.

Best PracticesSingle-point grounding is preferred for signal circuits to avoid ground loops; multi-point grounding is only used with isolation devices. Protective and functional grounds should remain separate until they reach the main grounding busbar. Clean and dirty grounds should be separated: heavy machinery currents (dirty ground) should not interfere with sensitive instrument grounds (clean ground),.

Bonding: All metallic trays, panels, and enclosures should be bonded to the busbar to provide a low-impedance path for fault currents. Shielding: Cable shields should be grounded at the control room end, and multiple shields should be collected at a common terminal to reduce noise.

Summary

Proper grounding of instrument cable trays and static busbars involves bonding metallic trays, connecting instrument cases to a common busbar, maintaining single-point grounding for signal shields, and separating clean and dirty grounds. Following these practices ensures safety, reduces electromagnetic interference, and maintains accurate instrument operation.

Article Content

Instrument Grounding Standards

This standard specifies the classification, methods, system structure, grounding resistance, and design principles of instrument system grounding. It aims to

Instrument Grounding: General Guidelines

Instrument grounds should be wired to a common bus bar within the control center, and this should be connected to a remote ground electrode via an

Instrument Earthing Systems

© 2026 BAGYOU FIBRE NETWORKS - All rights reserved

This above drawing illustrates the typical earthing (grounding) arrangement for a cable tray system in an industrial or commercial installation. It provides details on how to ensure proper

Grounding Requirements for Machinery Instrumentation and Noise

One approach to avoiding the problem is to interconnect the ground grids of the two buildings and install the cabling in grounded metal conduits between the two buildings.

Practices for grounding and bonding of cable trays

All metallic cable trays shall be grounded as required in Article 250.96 regardless of whether or not the cable tray is being used as an equipment grounding conductor (EGC).

Considerations for Instrument Grounding

When installing the equipment in a building, make sure to have an electrician check on the impedance to the ground and the grounding device to see if they comply

Grounding Requirements for Electrical Cables, Cable Trays, and

Guidelines for grounding electrical cables, busbars, and cable trays in wiring projects, ensuring safety and compliance with industry standards.

Instrumentation Earthing

All the instrument earth bars in the cabinets should be connected to a common instrument earth bar provided in the false floor / Cable cellar using an

Avoiding Mistakes in Instrumentation Cable Tray

This document lists the most typical mistakes that EPC teams should not make while installing instrumentation cable trays to make sure the plant runs

Instrument Grounding and Guide for the Right Setup

The ground connection at the cell cable or potentiostat are often ignored. Even though it may be best to just leave them disconnected, a proper ground connection may help reduce measurement noise

Cable Tray Grounding: Power, Instrumentation, and Telecommunications

Where cable tray systems contain only signal and communication circuits that operate at low energy levels, power grounding per NEC Section 318-7 is not appropriate, but cable tray grounding for

Compliance Requirements for Instrument Cable Trays

© 2026 BAGYOU FIBRE NETWORKS - All rights reserved

Installing instrument cable trays properly and in compliance with relevant standards is crucial to ensure safety, functionality, and durability. Below is a detailed guide

Instrument Grounding: General Guidelines

Find out more about the instrument grounding guidelines: how to ground instruments, cable screens, instrument cases & panel frames.

Avoiding Mistakes in Instrumentation Cable Tray

Learn how to avoid common mistakes in instrumentation cable tray installation. Follow IEC standards and EPC best practices for safe, reliable

Considerations for Instrument Grounding

Ground isolation or conduction can help to reduce noises and electro-magnetic interference. Examples include shielding rooms, cables, wirelines, guarded

Practices For Grounding and Bonding of Cable Trays

The document discusses grounding and bonding practices for metallic and non-metallic cable trays. Metallic cable trays must be grounded and can serve as an equipment grounding conductor if the

Grounding Inspection of Steel and Aluminum Cable Tray Systems

Steel and aluminum cable tray systems are excellent equipment grounding conductors if they are properly designed, specified, installed, and inspected. The NEC requirements for cable tray

Microsoft Word

It is preferable to run this grounding cable along the shortest distance feasible from the instrument or control panel star-point''s (discussed later) grounding lug to the grounding bed, in order to provide the
