Making cable trays smaller

Overview

We walk you through the "step by step" process of creating a cable tray reducer in under three minutes, making "cable management" and "cable containment" simpler than ever.

Key Takeaways

Cable trays can be made smaller using reducers or by selecting appropriately sized trays based on cable load and project requirements.

Using Cable Tray Reducers

Cable tray reducers are specialized components designed to transition from a larger tray to a smaller one smoothly, ensuring cables are not stressed or damaged during the transition. They are essential when the cable load decreases along a run or when space constraints require a narrower tray. Reducers can be tapered to maintain a continuous flow of cables and are available in materials like stainless steel, aluminum, or fiberglass to match the tray material and environmental conditions.

Proper installation ensures structural integrity and prevents cable strain.

Calculating the Correct Tray Size

Before reducing a tray, it is important to calculate the appropriate size based on the number and type of cables. Key considerations include: Cable cross-sectional area: Sum the areas of all cables to determine the minimum tray width. Fill capacity: Follow NEC or IEC guidelines to avoid overcrowding, which can cause overheating or electrical interference.

Heat dissipation: Smaller trays reduce airflow, so ensure adequate ventilation or use perforated trays. Future expansion: Consider potential additional cables to avoid frequent resizing.

Practical Methods for Reducing Tray Size

Field Modification: Some ladder or channel trays allow removal or repositioning of rungs to accommodate smaller cable loads without compromising bending radii. Reducers Installation: Install a tapered reducer at the transition point between the larger and smaller tray sections. Custom Fabrication: For unique angles or sizes, a single piece of tray can be cut and bent to form a custom reducer, following step-by-step guides for precise measurements.

Types of Trays Suitable for Smaller Loads

Channel trays: Compact and ideal for small control or instrumentation cables. Wire mesh trays: Flexible and easy to modify in the field, suitable for light power or data cables. Perforated trays: Provide ventilation while reducing tray width for smaller cable bundles.

Key Considerations

Always match reducer material to the tray to prevent corrosion or mechanical failure. Ensure cable bending radii are maintained to avoid damage. Verify load capacity and support spacing when reducing tray size to maintain structural safety.

Follow code compliance for cable fill and spacing to prevent overheating and ensure inspection approval. By combining proper sizing calculations, the use of reducers, and careful installation, cable trays can be effectively made smaller while maintaining safety, performance, and compliance.
