Marking lines on cable trays with bends

Overview

Trunking Cutting Techniques Guide | PDF | Metalworking | ToolsThe document provides instructions for forming various bends and joints in electrical trunkin.

Key Takeaways

Marking lines on cable tray bends requires precise measurement, use of a pencil for marking, and following V-cut or bend diagrams to ensure accurate bends and cuts.

Step-by-

Step Guide1. Measure and Plan the Bend Before marking, determine the type of bend required (90°, 45°, vertical, horizontal, or compound). Measure the horizontal run, vertical rise, and offset distance to calculate the exact bend location and angle.

Tools like measuring tapes, rulers, or digital calculators can help estimate the V-cut dimensions and bend points accurately. 2. Use a Pencil for Marking Always use a pencil to mark the cable tray.

Avoid permanent markers or pens, as they may not be visible after bending or may damage the tray surface. Mark the centerline of the bend and the edges where cuts or folds will occur. 3.

Mark V-

Cut Lines for Bends For angled bends, draw V-cut lines on the tray. The V-cut width depends on the tray width and bend angle. Use a fabrication diagram or calculator to determine the half-width and full-width of the V-cut.

Align the diagram with the tray and mark directly using a measuring tape. 4. Mark Internal and External Bend Lines For internal bends, mark the inside edge of the bend where the tray will fold.

For external bends, mark the outside edge. Ensure that the marks are parallel to the tray edges and consistent on both sides of the tray. 5.

Check Alignment and Symmetry Double-check all measurements and marks before cutting or bending. Ensure that the side rails and bottom of the tray are aligned and that the bend will not interfere with slots or mounting points. 6.

Use Clamps or Bending Bars When ready to bend, use tray bending bars or adjustable clamps to hold the tray in place. This ensures the bend follows the marked lines accurately and prevents deformation. 7.

Deburr and Finish After cutting along the marked lines, deburr all edges to remove sharp metal fragments. This prevents damage to cables and ensures a professional finish.

Tips for Accuracy

Always mark both sides of the tray for consistency. Use templates or SVG diagrams from fabrication calculators for complex bends. For vertical bends, consider the tray's slope and riser height to maintain proper cable routing.

Avoid cutting across slots unless specified, as this can weaken the tray. By following these steps, you can achieve precise, professional bends in cable trays, ensuring safe and efficient cable routing.

Cable Tray Technical Guide A practical guide to product selection and ...

In designing supports for a cable tray system, consideration should be given to the loads associated with future cable additions and any additional loading that may be applied to the cable tray system (e.g.,

Cable tray manual

All the technical information developed by the 1973 NEC®Technical Subcommittee on Cable Tray for Article 318 - Cable Trays was based on cable trays with side rails and this technical information is still

GUIDE CABLE TRAYS TECHNICAL

For consistency with the corrosion resistance of accessories and cable trays, and minimise corrosion breaking lines due to the galvanic couple, we recommend the following assemblies:

Master the Cable Tray Secret to Perfect Back of Bend ...

How to Master back of bend measurements on electrical Cable Tray. Make a 90 electrical cable tray bend to measurement with a gusset of your choice using one piece of tray.

Assembly Guide

Guide for making bends, tees, crosses, risers and reducers from straight sections of wire basket cable trays live at the project.

Wire Mesh Tray Technical Guide

The NEMA VE standard for cable trays is the "product" standard which defines the requirements and tests for cable tray and cable ladder systems. As IEC 61 537 is the only harmonized standard at a

Document DICOS

To install the cable tray supports, first find the required elevation from the floor to the bottom of the cable tray and establish a level line with a laser or a nylon string.

0.6/1kV Non-Armoured Fire-Suppression Trunk Cable for Indoor Cable Tray ...

0.6/1kV Non-Armoured Fire-Suppression Trunk Cable for Indoor Cable Tray, Conduit, Commercial Building & Industrial Fire-Class Power Distribution Layout

Cable tray manual

INTRODUCTION The B-Line series Cable Tray Manual was produced by our technical staff. We recognize the need for a complete cable tray reference source for electrical engineers and designers.
