Material for sealing vertical shaft cable trays

Overview

Choose appropriate fire protection materials, such as fire-rated board, firestop packs, firestop mastic, or fire-resistant mineral wool.

Key Takeaways

Sealing vertical shaft cable trays involves preparing the opening, selecting appropriate firestop or sealing materials, installing backing or modular frames, and applying sealants to ensure a tight, compliant, and maintainable closure. Step 1: Prepare the Shaft OpeningEnsure that the floor and wall finishes are completed and that shaft doors are installed. Remove any debris and verify that the cable tray is properly positioned and supported.

For large openings, consider installing a fire-resistant backing plate to provide a stable base for the sealant or modular system ( ). Step 2: Select Appropriate Sealing MaterialsChoose materials based on the hazards and environment: Fire-rated materials: firestop boards, firestop packs, or mineral wool for fire protection ( ). Weatherproof or chemical-resistant materials: silicone-based sealants, water-resistant pads, or modular frames for outdoor or wet environments ( ).

Modular sealing systems: such as Roxtec frames, which allow for future cable additions or changes without compromising the seal ( ). Step 3: Install Backing or Modular FramesFor modular systems, insert the frame into the shaft opening. Frames can be cast, bolted, or welded depending on the construction type.

Ensure the frame encompasses the entire cable tray at the penetration point and is level and square ( ). Step 4: Pack and Seal Around CablesPlace firestop packs or sealing modules around the cables in an orderly sequence. Ensure that gaps between cables and packs do not exceed 1 cm^2 and that the packing thickness meets minimum requirements (typically ≥24 cm for fire-rated applications) ( ).

Apply sealant (e.g., silicone-based or NOFIRNO®) to fill any remaining voids, both internally and externally, ensuring a continuous, crack-free seal ( ). Step 5: Install Cover PlatesAttach cover plates to close the opening. Plates should be square, consistent in size, and evenly painted if required.

This step ensures mechanical protection and aesthetic uniformity ( ). Step 6: Verify and MaintainInspect the seal for tightness, absence of cracks, and proper alignment. Ensure that the installation complies with fire, safety, and environmental standards.

Plan for future cable additions or maintenance by using modular or removable sealing systems ( ). By following these steps, vertical shaft cable trays can be safely sealed, providing fire protection, environmental resistance, and flexibility for future modifications.

Firestopping Requirements for Cable Trays and

Choose appropriate fire protection materials, such as fire-rated board, firestop packs, firestop mastic, or fire-resistant mineral wool. Firestop

Cable Tray Technical Guide A practical guide to product selection and ...

In designing supports for a cable tray system, consideration should be given to the loads associated with future cable additions and any additional loading that may be applied to the cable tray system (e.g.,

Firestop

3M Fire Barrier Moldable Putty+ is a one-part, halogen-free product designed to firestop electrical outlet boxes and a wide variety of through-penetrations including cable, conduit, insulated pipe and metal

Fireproof pillow for cable tray penetrations

The product is certified for "small" - "medium" and "large" cable penetrations, to create a fireproof seal for cables with a diameter of

Performance Evaluation of Cable Shaft Fireproof Sealing

© 2026 BAGYOU FIBRE NETWORKS - All rights reserved

The effectiveness of fireproof sealing systems in preventing the spread of fire in high-rise building cable shafts relies on the properties of various sealing materials and the construction process.

Performance evaluation for fireproof sealing system of cable shaft in ...

Therefore, based on the entropy method, this paper proposes a performance evaluation system for the fireproof sealing system of cable shafts in high-rise buildings.

Performance Evaluation of Cable Shaft Fireproof Sealing

The authors of this paper propose a comparative test method based on an entity test platform for a performance evaluation of cable shaft fireproof sealing systems in high-rise buildings.

Firsto System | CSD Sealing Systems

FIRSTO firestops are designed to seal multi-cable and cable tray penetrations of fire-rated walls and floors. FIRSTO fire stops are developed as a modular system which is simple to assemble around

Penetration Seals

For this type of application, expanding intumescent materials are usually a very effective solution. Need to know exactly which fire stopping solutions fit your requirements? Use our solution finder to select

Firestop

The following charts give the number of 3M pillows needed to completely firestop an opening that cable tray passes through.* Two (2) sticks of moldable putty (part number FSP-MPS) are also needed for

Promat Fire Stopping Handbook

ed seal for walls and floors. It is designed to be used with single cables, cable bundles or combustible and non-combustible pipes to prevent the s read of smoke, fire and heat. In addition the fire stopping

Best Practices for Installing Cables in Trays

Learn the best practices for installing cables in trays. This guide covers essential steps, technical requirements, and key details for efficient cable

Effective weatherproofing for cable trays | Jones Weatherproofing

In vertical wall penetrations, weatherproofing cable trays is often carried out using a weatherstop sealing system. From the outside, this looks like ductwork or a series of boxes attached
