Measurement of seismic bracing dimensions for cable trays

Overview

Design and Installation Manual for Seismic Bracing of Cable TraysIt explains when you need bracing, how you should review support layouts, which components.

Key Takeaways

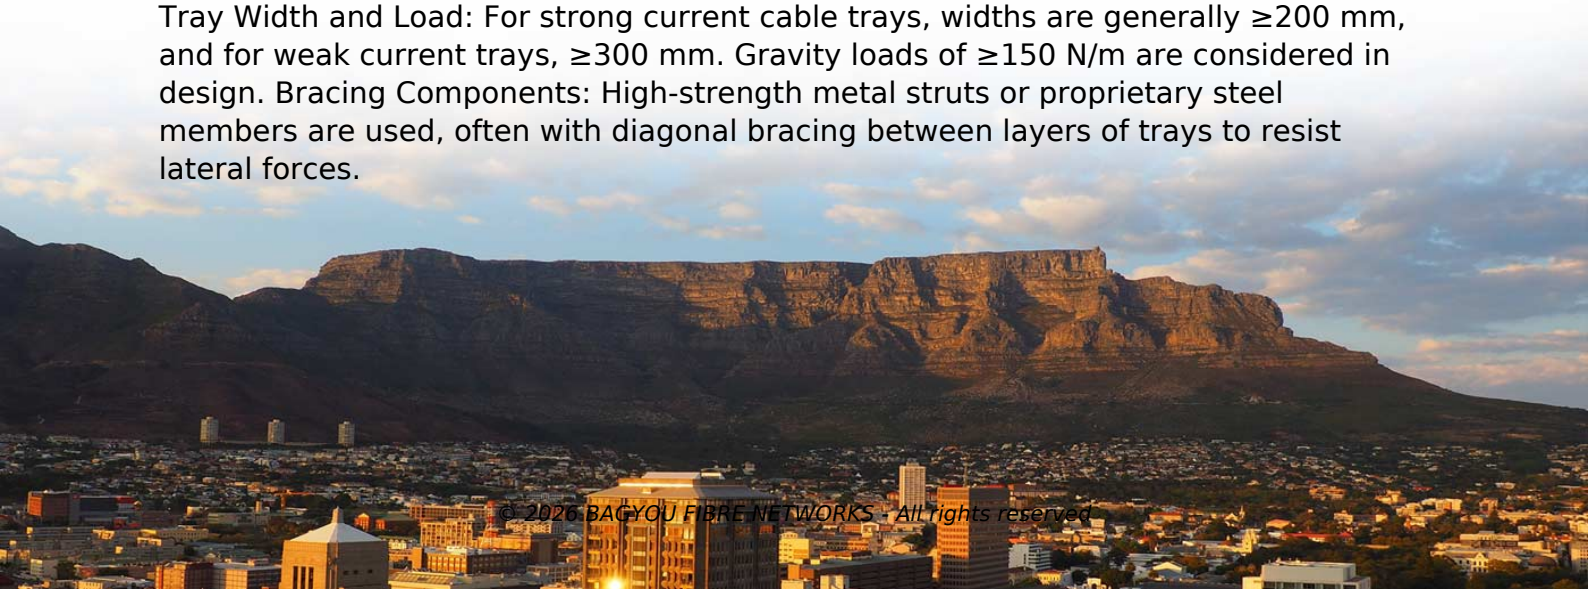

Seismic bracing for cable trays is typically customized based on cable load, tray type, and seismic zone, with modular metal components designed to resist lateral and vertical forces.

General Design Considerations

Seismic bracing is required when cable trays carry critical power or communication cables, are suspended above occupied areas, or feed emergency systems. The bracing system forms a continuous load path from the tray to the building structure, using strut channels, clamps, connectors, and anchors to resist lateral sway, longitudinal movement, and anchor pullout during seismic events.

Typical Dimensions and Spacing

Tray Width and Load: For strong current cable trays, widths are generally ≥200 mm, and for weak current trays, ≥300 mm. Gravity loads of ≥150 N/m are considered in design. Bracing Components: High-strength metal struts or proprietary steel members are used, often with diagonal bracing between layers of trays to resist lateral forces.

Spacing: Bracing spacing is determined by tray type, cable weight, and seismic design category. Ladder trays are preferred for primary distribution due to their stiffness and strength, while perforated or trough trays require careful evaluation of support spacing. Customization: Modular bracing components can be prefabricated and adjusted to fit specific tray routes, with reinforcement ribs added as needed to enhance seismic capacity.

Seismic Load Capacity: Bracing systems are tested to withstand floor acceleration loads up to 1. 8 g, suitable for simulated earthquakes of magnitude 7–9.

Installation Notes

Bracing should not rely solely on attachment to exterior walls or roofs; it must connect directly to structural elements capable of resisting seismic forces. Components often feature serrated rolled edges for rigid assembly, preventing slippage and enhancing shear resistance. Prefabricated modular systems allow for easy disassembly, modification, and recycling, facilitating installation in complex layouts.

Summary

While exact dimensions vary by project, seismic bracing for cable trays generally involves high-strength modular metal components, diagonal and longitudinal bracing, and customized spacing based on tray type, cable load, and seismic design criteria. Proper design ensures that cable trays remain secure during earthquakes, protecting critical electrical and communication systems.

The seismic performance levels of cable tray systems are presented according to current seismic design codes. A performance-based optimum seismic design procedure for cable tray

800.321.LOOS (5667) SEISMIC DESIGN GUIDE CABLE BRACING

design and installation of our Seismic Cable Bracing System. All of the materials and products presented have been design d and tested to exceed the requirements set forth in NFPA-13. In fact, the

Seismic and cable tray solution flyer

Our team of experts can help you select the best cable tray series for your application, as well as designing your seismic bracing layout to ensure it meets applicable building codes and standards.

Cable Tray and Conduit System Seismic Evaluation Guidelines

Rigid-mounted conduit and cable trays are inherently very stable and subject to minimal seismic amplification. A detailed dead load design review of these systems provides ample margin for

Seismic Bracing Systems for Cable Trays Catalog

Explore seismic bracing solutions for cable trays. Catalog details wire rope/cable systems, specs, design for earthquake protection.

Rev 7 to Procedure SAG.CP3, "Seismic Design Criteria for Cable Tray ...

This docussat provides the seismic design guideline for cable tray hangers of Comanche Peak Steam Riectric Station Unit No. 2. These guidelines summarise the design parameters,

Specifications of seismic bracing for cable trays in basements

This appendix provides the design criteria for seismic Category I cable trays and their supports. Seismic Category II cable trays and their supports are also designed utilizing the design criteria of this appendix.

V.C. Summer Nuclear Station, Units 2 and 3, Rev. 3 to Updated ...

Cable Trays and Cable Tray Supports This appendix provides the design criteria for seismic Category I cable trays and their supports. Seismic Category II cable trays and their supports are also designed

Design and Installation Manual for Seismic Bracing of Cable Trays

1. When Seismic Bracing Is Required for Cable Tray Seismic bracing requirements usually come from the project building code, the structural design basis, local authority requirements,
