Model of Level 1 Construction Site Distribution Box

Overview

The Hierarchical Structure Of The Three-level Power Distribution Box The power distribution from the power input point to the end electrical equipment need.

Key Takeaways

A Level 1 construction site distribution box is designed for main circuit isolation, includes a main circuit breaker and fuse, shunt isolation, and shunt leakage protection, suitable for outdoor construction site use.

Overview

A Level 1 distribution box is the primary power distribution unit on a construction site, intended to safely manage and distribute electricity from the main supply to secondary distribution points. It is specifically designed to meet construction site conditions and comply with relevant construction electricity standards.

Key Features

Main Circuit Isolation: Equipped with a main circuit breaker and main fuse to control and protect the incoming power supply. Shunt Isolation and Leakage Protection: Includes shunt isolation switches and shunt leakage protection devices to prevent electrical hazards.

Construction-

Specific Design: The box is rainproof, suitable for outdoor use, and designed with a bottom-in and bottom-out line configuration for easy cable management. Internal Components: Typically contains copper busbars for main connections, internal metering systems, and robust handles for safe operation. Safety Standards: Designed to comply with construction electricity regulations, ensuring protection against overloads, short circuits, and leakage currents.

Typical Applications

Primary Distribution: Serves as the first-level distribution point, supplying power to secondary distribution boxes or directly to high-demand equipment on site. Protection System: Forms part of a three-level protection system on construction sites, achieving "one machine, one switch, one protection" for safety and operational efficiency. Outdoor Construction Sites: Suitable for temporary or semi-permanent installation in construction zones, with a rainproof top and durable enclosure.

Installation Considerations

Placement: Should be installed on a stable surface, often elevated slightly above ground to prevent water ingress. Connection: Bottom-in and bottom-out cable entry ensures safe and organized wiring. Maintenance: Regular inspection of circuit breakers, fuses, and leakage protection devices is recommended to maintain safety and compliance.

Level 1 distribution boxes are essential for safe and efficient power management on construction sites, providing the first line of protection and control for all downstream electrical equipment.
