New Type of Bundled Pigtail Fiber for Field Operations

Overview

Fiber Optic Pigtails: Uses & Differences from Patch CordsIn this guide, we will break down what fiber optic pigtails are, how they differ from patch cords.

Key Takeaways

Bundled fiber optic pigtails are pre-assembled multi-fiber units designed for efficient field splicing, high-density terminations, and reliable network deployment.

Overview

A fiber optic pigtail is a short optical fiber with a factory-terminated connector on one end and a bare fiber on the other, allowing for precise, low-loss splicing to field cables ( ). Traditional pigtails are typically single-fiber, but bundled pigtails group multiple fibers—commonly 12 fibers—into a single unit, each color-coded for easy identification ( ). This design is particularly useful in high-density ODFs, data centers, and field operations where multiple fibers must be terminated simultaneously.

Key FeaturesMulti-Fiber Configuration: Bundled pigtails often come in 12-fiber sets, with options for 24, 48, or more fibers for large-scale deployments ( ).

Coded Fibers: Each fiber in the bundle is color-coded according to TIA/EIA standards, simplifying identification and reducing splicing errors ( ). Fiber Types: Available in single-mode (9/125 µm) and multimode (OM1, OM2, OM3, OM4), allowing compatibility with existing network infrastructure ( ). Connector Options: Common connectors include LC, SC, ST, FC, MT-RJ, and E2000, with UPC or APC polish types depending on application requirements ( ).

Field Splicing Ready: The bare fiber end is designed for fusion or mechanical splicing, enabling fast, reliable connections in the field ( ).

Advantages for Field Operations

Time and Labor Savings: Factory-terminated connectors reduce the need for on-site polishing, speeding up deployment ( ).

High-

Density Termination: Bundled pigtails allow multiple fibers to be spliced simultaneously, ideal for data centers or high-fiber-count ODFs ( ). Durability: Options include armored or waterproof pigtails, providing protection against harsh environments, rodents, or mechanical stress ( ). Reduced Signal Loss: Factory-polished connectors ensure low insertion loss and high return loss, improving long-term network performance ( ).

Practical Applications

Telecom and FTTH Deployments: Efficiently terminate multiple fibers from a main cable into subscriber lines. Data Centers: High-density ribbonized pigtails allow mass fusion splicing, reducing installation time. Harsh Environments: Armored or waterproof bundled pigtails maintain network reliability in outdoor or industrial settings ( ).

Conclusion

Bundled fiber optic pigtails combine the precision of factory-terminated connectors with the flexibility of field splicing, making them ideal for modern high-density and harsh-environment deployments. Their multi-fiber design, color-coded identification, and robust construction significantly improve installation efficiency, reduce errors, and enhance long-term network reliability ( ).
