Should cables be run in cable trays or on the ground

Overview

All metallic cable trays must be grounded as outlined in NEC Article 250.96, even if the tray isn''t being used as an equipment grounding conductor (EGC).

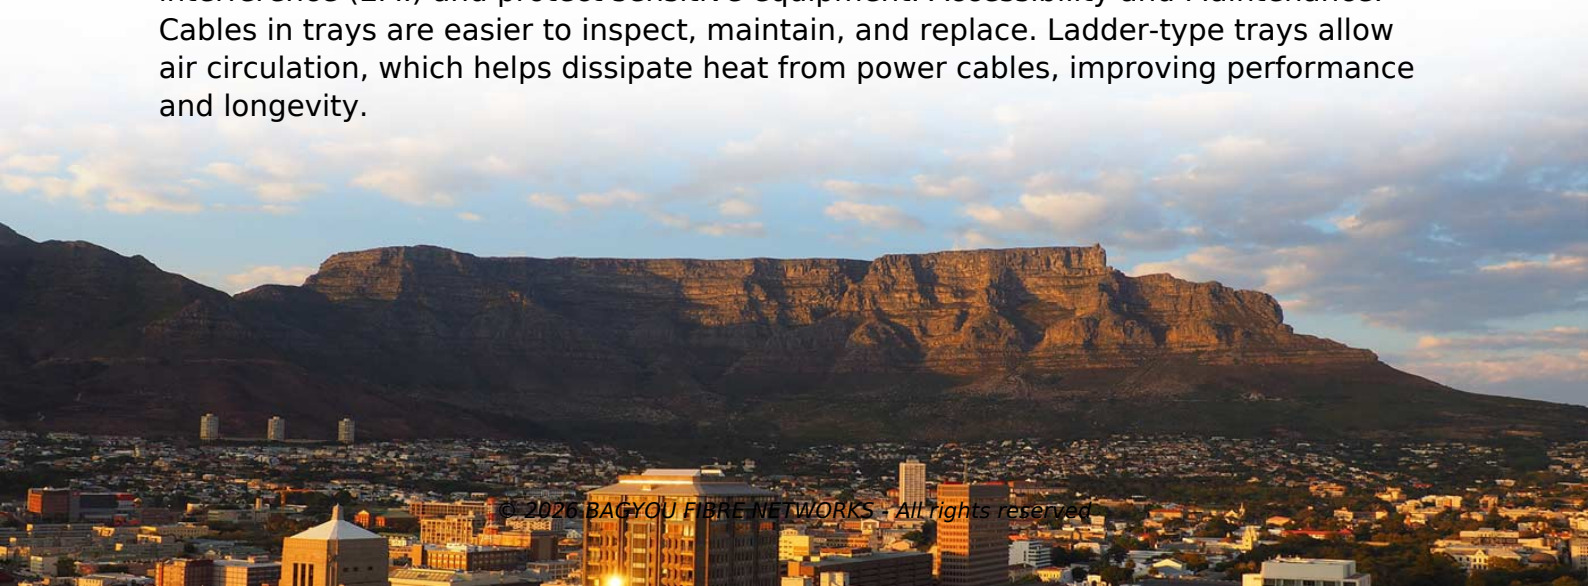

Key Takeaways

Cables should generally be run in a cable tray rather than along the ground for safety, accessibility, and compliance with electrical codes.

Advantages of Using Cable Trays

Safety and Protection: Cable trays elevate cables off the ground, reducing the risk of physical damage from foot traffic, equipment, or environmental hazards. They also help prevent tripping hazards and accidental contact with live wires. Grounding and Electrical Safety: Metal cable trays can serve as an Equipment Grounding Conductor (EGC) when properly bonded, providing a low-impedance path for fault currents and protecting personnel and equipment from electrical hazards.

Proper bonding and grounding of cable trays also minimize electromagnetic interference (EMI) and protect sensitive equipment. Accessibility and Maintenance: Cables in trays are easier to inspect, maintain, and replace. Ladder-type trays allow air circulation, which helps dissipate heat from power cables, improving performance and longevity.

Solid-bottom trays are suitable for shielding sensitive signals from EMI. Code Compliance: NEC Article 392 provides guidelines for cable tray installation, including support, spacing, and cable types. Using trays ensures compliance with these safety standards, which is particularly important in industrial or commercial installations.

When Ground Installation May Be Considered

Running cables along the ground is generally discouraged except in temporary setups or where trays are impractical. Ground-laid cables are more susceptible to mechanical damage, moisture, and interference. If ground installation is unavoidable, cables should be protected with conduits, covers, or cable ramps to reduce risk.

Best Practices for Cable Tray Installation

Use UL-listed bonding clamps and ensure trays are bonded to building steel or grounding systems every 50–65 feet. Select the appropriate tray type: ladder trays for heat dissipation and heavy power cables, solid-bottom trays for EMI-sensitive circuits. Avoid placing bare copper grounding conductors in aluminum trays to prevent corrosion; use insulated conductors with proper bonding connections.

Ensure cables are tray-rated (Type TC) or metal-armored (Type MC) to withstand exposure in open trays.

Conclusion

For permanent, safe, and code-compliant installations, running cables in a cable tray is strongly recommended over laying them on the ground. Cable trays provide mechanical protection, facilitate grounding, improve accessibility, and reduce the risk of electrical hazards, making them the preferred choice in most professional and industrial environments.

Master NEC Article 392 with our comprehensive guide. Learn essential cable tray requirements for installation, grounding, and fill capacity to

Best practices for underfloor cable management

All cables should be supported in cable tray that is run overhead, above the equipment or under the raised floor. This paper addresses the routing of cable pathway beneath a raised floor to maintain

Installation Of Cable In Cable Trays: NEC, Safety

Cable tray layout must take into consideration the design limits of the cable. To minimize damage and verify integrity after installation, follow the practices outlined in cable handling and testing procedures

Explaining NEC Article 392 on Cable Trays

Cables and conductors must be secured to the cable tray at intervals according to installation instructions. For non-horizontal runs, cables should be fastened securely to transverse

Can Tray Cables Be Buried Underground?

Tray cables can be buried underground, but only if they are specifically designed and rated for direct burial. Not all tray cables are suitable for underground installation, and using the

Cable Tray Questions | Cable Tray Institute

Question 1: Can mechanical utility piping or tubing containing water or compressed air be installed in cable trays with electrical cables? Answer: No. Cable trays are a support system for electrical cables,

NEC: Cable Tray Tips | EC&M

Strongly consider using cable trays whenever it is permitted for applications that include many conductors. Cable trays solve many design and installation problems, save money, and

Cable Tray Fill Rules (NEC 392)

Cable Tray Fill and Installation per NEC 392 Cable tray types, fill rules for single-conductor and multiconductor cables, ampacity derating, separation requirements, and when to use

Installing fiber-optic cable in premises applications

Optical-fiber cable should always be run in trays to avoid as much tension, crushing and bending as possible. Routes should be inspected for sharp turns, snags (sometimes from other cables) and
