Switches divide devices into VLANs

Overview

VLAN is a new data exchange technology that logically divides LAN devices (note, not physically) into network segments to realize virtual workgroups. • This means that switches from different vendors are able to exchange VLAN traffic. Traffic between VLANs must now go through a router. By the end, you'll understand how to. A Virtual Local Area Network (VLAN) is a logical grouping that segments a network into smaller broadcast domains. VLANs allow you to separate network devices into distinct groups, even if those devices connect to the same physical switch or to different switches. This segmentation enhances network. Network segmentation with switches involves dividing a network into smaller, isolated segments to enhance security, improve performance, and simplify management.
