There s also a wire next to the fiber optic cable

Overview

A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry light. The optical fiber elements are typically individually coated with plastic layers and contained in a protective tube suitable for the environment where the cable is used.

Key Takeaways

Standard fiber optic cables do not have a wire for transmitting electricity, but some specialized types include metallic or strength members for support or attachment.

Standard Fiber Optic Cables

Typical fiber optic cables consist of one or more optical fibers that carry light signals, surrounded by protective coatings, buffer layers, and an outer jacket for environmental protection. These cables do not include a metal wire for electrical conduction; instead, they may contain non-conductive strength members such as aramid yarn, fiberglass rods, or Kevlar to provide tensile strength and prevent fiber damage during installation. Pull ropes or wires may be temporarily attached to these strength members during installation, but they are not part of the cable's core functionality.

Fiber Optic Cables Attached to Power Lines

© 2026 BAGYOU FIBRE NETWORKS · All rights reserved

Some fiber optic cables are designed to be installed along overhead power lines. These include: Optical Attached Cable (OPAC): Wrapped, lashed, or clipped to a host conductor, such as a power line, for support. Optical Power Ground Wire (OPGW) and Optical Power Phase Conductor (OPPC): These cables combine optical fibers with metallic conductors inside the same cable, allowing them to carry both communication signals and electrical power or grounding functions.

In these cases, the fiber optic cable does have a wire or metallic conductor integrated, but this is specific to utility applications and not typical for standard indoor or outdoor data cables.

Summary

Standard fiber optic cables: No electrical wire; only optical fibers with protective and strength layers. Specialized utility cables (OPGW, OPPC, OPAC): Include metallic conductors or are attached to existing wires for support and dual functionality. Thus, whether a fiber optic cable has a wire attached depends on its type and application.

For most internet or data installations, the cable itself is purely optical without any electrical wire.
