Thickness of inner partition plate in galvanized cable tray

Overview

4.2.2 Metallic cable trays shall have adequate mechanical strength and rigidity to provide adequate support without undue deflection.

Key Takeaways

The inner partition plate in galvanized cable trays typically ranges from 1. 5 mm to 3 mm, depending on tray type, load class, and manufacturer specifications.

General Guidelines

In galvanized steel cable trays, inner partition plates are used to separate different cable types or circuits within the same tray, providing organization, reducing electromagnetic interference, and supporting smaller instrumentation or control cables. The thickness of these plates is influenced by: Tray width and height: Wider or deeper trays may require thicker partitions for structural stability. Load class: NEMA or IEC load ratings determine the mechanical strength required; higher load classes often use thicker plates.

Galvanization process: Hot-dip galvanization adds a thin zinc layer, which slightly increases overall thickness but does not significantly affect structural performance. Application environment: Outdoor or corrosive environments may require thicker or reinforced partitions to resist bending or corrosion over time. Typical Thickness RangesLight-duty trays (for small instrumentation or control cables): 1.

© 2026 BAGYOU FIBRE NETWORKS · All rights reserved

5–2 mmMedium-duty trays (for mixed power and control cables): 2–2. 5 mmHeavy-duty trays (for large power cables or high mechanical stress): 2. 5–3 mm These values are consistent with common industry practices for B-Line series, ABB, and Legrand cable trays.

Manufacturers may provide specific datasheets indicating the exact thickness for each tray model and partition configuration.

Additional Considerations

Splice plates and supports: Inner partitions are often integrated with splice plates or support brackets, which may require additional thickness or reinforcement to maintain structural integrity. Ventilation and EMI/RFI shielding: Solid partitions may be perforated or ventilated; thickness should balance mechanical strength with airflow and shielding requirements. Compliance: Ensure that the chosen thickness meets NEMA VE-1/VE-2 or IEC 61537 standards for cable tray systems.

For precise design or fabrication, it is recommended to consult the manufacturer's technical datasheet or engineering department, as the optimal thickness may vary based on specific project requirements and environmental conditions.

In designing supports for a cable tray system, consideration should be given to the loads associated with future cable additions and any additional loading that may be applied to the cable tray system (e.g.,

B-Line series pan tray catalog

Solid flanged covers should be used when maximum enclosure of the cable is desired and no accumulation of heat is expected. Louvered flanged covers should be used when heat dissipation is

B-Line series Cable Tray Design Considerations

Snow load is measured by density and thickness, and it can be significant for a cable tray that is completely full of cables or a cable tray that has covers. The density of snow varies greatly due to its

CABLE TRAY

We manufacture a wide range of products capable of providing the characteristics which respond to the proposed application, along with quality of assembly, speed of installation, and cost-saving cable trays.

Document DICOS

Splice plates should be placed on the outside of the cable tray, unless otherwise specified by the manufacturer, with the bolt heads on the inside of the cable tray (see Figure 3-37).

Cable Trays and Accesories

SFSP manufactures a wide range of products capable of providing the characteristics which respond to the proposed application, along with quality of assembly, speed of installation, and cost-saving cable

Cable Tray Dimensions Guide: Standard Sizes, Tray

In practice, cable tray dimensions are a system of interrelated measurements —width, depth, length, and material thickness—that directly
