Which port should be used on the access layer switch

Overview

Mastering Switch Port Configuration: Avoiding Common Pitfalls in. Optimize enterprise switch deployments by mastering port configuration. Learn to preven.

Key Takeaways

Access layer switch ports are configured in access mode to connect end devices to a single VLAN, ensuring proper network segmentation and communication.

Configuring Access Ports

Set the port to access mode: This ensures the port only carries traffic for a single VLAN and does not participate in trunking. On Cisco switches, the command is: CodeCopyinterface FastEthernet0/1switchport mode access Assign the VLAN: Specify which VLAN the port belongs to. For example, to assign VLAN 10: CodeCopyswitchport access vlan 10 Verify configuration: Use commands like show running-config or show interfaces switchport to confirm the port is in access mode and assigned to the correct VLAN.

Access ports are typically used to connect end devices such as PCs, printers, and IP phones. They carry traffic for a single VLAN, providing a simple and secure connection.

Physical Connections in Access Layer

Direct device connection: Connect each end device directly to an access port on the switch using standard Ethernet cables. Switch-to-switch connections: If connecting multiple access switches, uplinks can be configured as access ports if only a single VLAN is needed, or as trunk ports if multiple VLANs must traverse the link.

Best Practices for Access Layer Switch Topology

Redundant uplinks: Connect each access switch to the distribution or core layer using multiple uplinks or port channels to avoid a single point of failure. Hierarchical design: Typically, a 2960-48T switch can serve as the main access switch on a floor, with smaller 2960-24T switches connected to it. This reduces the number of ports used on the core switch while maintaining redundancy.

VLA

N assignment per floor: Assign VLANs consistently across floors or departments to simplify management. For example, all ports on the 10th floor could be VLAN 10, and all ports on the 9th floor VLAN 9.

Summary

To connect devices on access layer switches: Configure ports in access mode. Assign the appropriate VLAN. Connect end devices directly to these ports.

For multiple switches, use hierarchical uplinks with redundancy to the core or distribution layer. Verify configurations to ensure proper VLAN membership and connectivity.
